

Wood pellet bedding for small animals, cats, reptiles, hamsters and all other small animals using 100% Aspen is safe and the best pellets to use. The pellets are sterile when manufactured, ammonia is a strong smelling chemical produced in the feces and can reduce a animals ability to fight infection if it is allowed to build up in unchanged bedding. Our Aspen pellet contains no phenols and harmful chemicals as found in pine and cedar materials.

Wood Pellet bedding for: Cat the Pellets are 100% sterile and made from top-quality virgin wood fiber materials with no additives of any kind, making them the perfect bedding material for your cat. Containing a lower moisture content than freshly cut timber, (typically 6%) helps to greatly reduce the occurrence of molds, molds, bacteria and mites resulting in a healthier and happier cat. Benefits You will notice a decrease in ammonia gas in your litter box. The Aspen has a natural ammonia absorber you will notice less smell when you use wood pellets as bedding, so less Cats will be warm, dry and more active.

RECYCLABLE

KITTY LITTER PELLETS

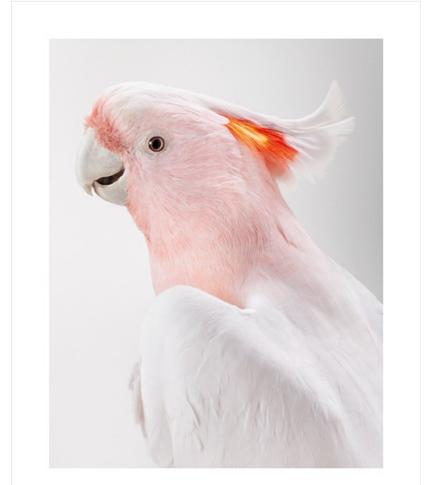

All creatures love clean dry bedding

BEDDING TIPS!

BEDDING TIPS! Bedding Tips: The most important things to remember regarding your choice of bedding is that it should be: -Dust Free, Mold Free Ammonia Free. Ammonia is a strong smelling chemical produced in the feces and can reduce a cat's ability to fight infection if it is allowed to build up in unchanged bedding. By using the wood based product as bedding for small animals, ammonia levels in the litter box stay low or are absent for the time between litter box cleaning. Also, as ammonia is absorbed in the wood based product, no nitrogen is released to the air. The bedding formed from the wood based product is initially dry and stays dry for a complete cleaning cycle. The bedding absorbs all or almost all moisture out of cat waste.

BIRDS

The bedding formed from the wood based product is initially dry and stays dry for a complete production cycle. The bedding absorbs all or almost all moisture out of bird waste. The dry bedding provides better feet quality and less joint strain. Thus, birds have better mobility and better feed/water access, which increases growth rates. There is no moisture to attract flies. The dry environment provides less stress on the respiratory system of the bird. The bedding stays soft and less abrasive on breasts of birds because no or only a little caking of the fibres occurs in the bedding. This lowers the likelihood of infection from open wounds.
